

Influence of sex on the persistence of different classes of targeted therapies for psoriatic arthritis

a cohort study of 14,778 patients from the French health insurance database (SNDS)

**Laura Pina Vegas, Laetitia Penso, Emilie Sbidian, Pascal Claudepierre

Disclosure

I have no relevant financial relationship with ineligible companies to disclose

- ▶ Psoriatic arthritis (PsA) is a heterogeneous chronic inflammatory rheumatic disease
- ▶ Sex differences in phenotype presentation, disease trajectory, and treatment response in PsA have been reported¹
- ▶ Several cohort studies and registries have reported sex-related disparities in the TNFi response in PsA but no formal conclusions can be drawn from these studies^{2,3}
- ▶ Few studies have included the most recently marketed molecules, and the existing data on other targeted therapies in PsA is sparse⁴

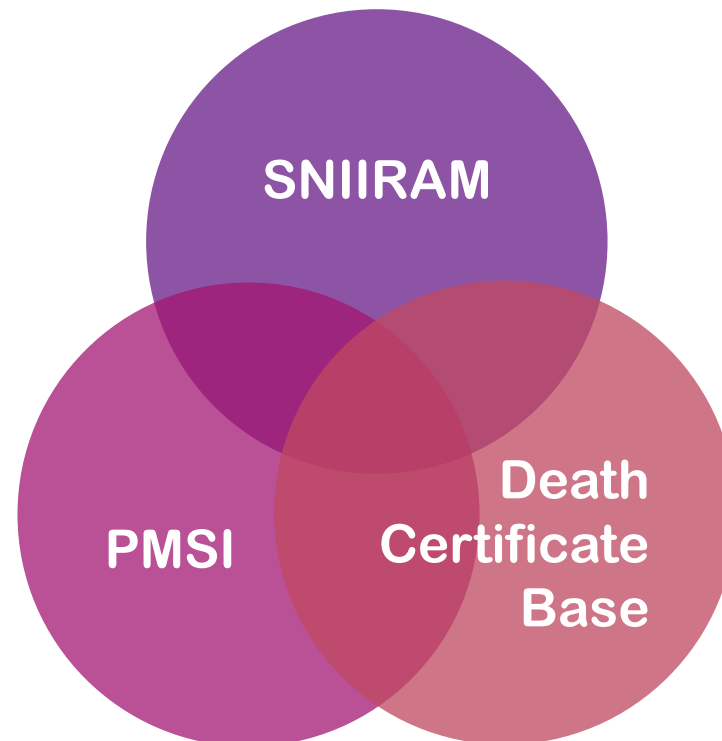

To evaluate the effect of sex on the long-term persistence of each targeted therapeutic class in PsA

French National Health Insurance Database (SNDS)^{1,2,3}

≈ 99% of the French population

National Health Insurance System (SNIIRAM)

Age, sex, social deprivation, reimbursed treatments dispensed in pharmacies, paramedical interventions, reimbursed care for long-term diseases

National Hospital Discharge System (PMSI)

Dates of hospital admission and discharge
Diagnosis codes for the main and accompanying diagnosis

Death Certificate Base

Dates of death
Diagnosis codes of death

¹Tuppin P et al. Rev Epidemiol Sante Publique. 2017 ; ²Meyer et al. Ann Intern Med. 2019; ³Hoisnard L et al. Ann Rheum Dis. 2023.

- ▶ **All adults identified with PsA¹**
 - ICD-10: M07 except M07.4 and M07.5
 - inpatients admitted with the ICD-10 diagnostic code for PsA
 - patients with fully reimbursed care procedures related to PsA
- ▶ **New users of a targeted therapy (“first line”)**

New users: no prescription of a targeted therapy the year before inclusion

Targeted therapies: **TNFi** (adalimumab, certolizumab, etanercept, golimumab, infliximab); **IL17i** (ixekizumab, secukinumab); **IL12/23i** (ustekinumab); **IL23i** (guselkumab, tildrakizumab, risankizumab) ; **JAKi** (tofacitinib, upadacitinib)
- ▶ **All treatment lines**

Persistence of a targeted therapy

Defined as the time between treatment initiation and discontinuation

- ▶ **Inclusions: from January 1, 2015 to June 30, 2021**

- ▶ **Study end point: December 31, 2021**

- ▶ **Follow-up until:**
 - Main outcome
 - Death
 - End of treatment exposure
 - Lost to follow-up
 - Study end point

► Sociodemographic:

Age, deprivation index (geographical indicator of social disadvantage)¹

► Associated inflammatory diseases:

Psoriasis, IBD, uveitis

► Comorbidities:

Charlson index, obesity (proxy), tobacco use (proxy), alcohol use (proxy)

► Other treatments of interest:

csDMARDs, NSAIDs, prednisone

► Care consumption:

Hospitalizations for PsA, specialist consultations, corticosteroids injections, opioids use, work stoppages

- ▶ Changes in treatment persistence over time (for each sex and therapeutic class): Kaplan-Meier method
- ▶ Multivariate frailty models (non-independence of data)
- ▶ Adjusted for co-variables at baseline and time-dependent covariates (csDMARDs, NSAIDs, prednisone during follow-up)
- ▶ Bonferroni adjustment: $p \leq 0.01$ was considered significant, 99% CIs were estimated

▶ Subgroup analysis:

- Patients without active skin psoriasis
- Patients <51 years old or ≥51 years (average age of menopause in France¹)

▶ Sensitivity analysis:

- Modifying the date of censoring
- Modifying the gap period to 90 days
- Modifying the definition of new users

Results

Sensitivity analysis

Intention to treat

Gap: 90 days

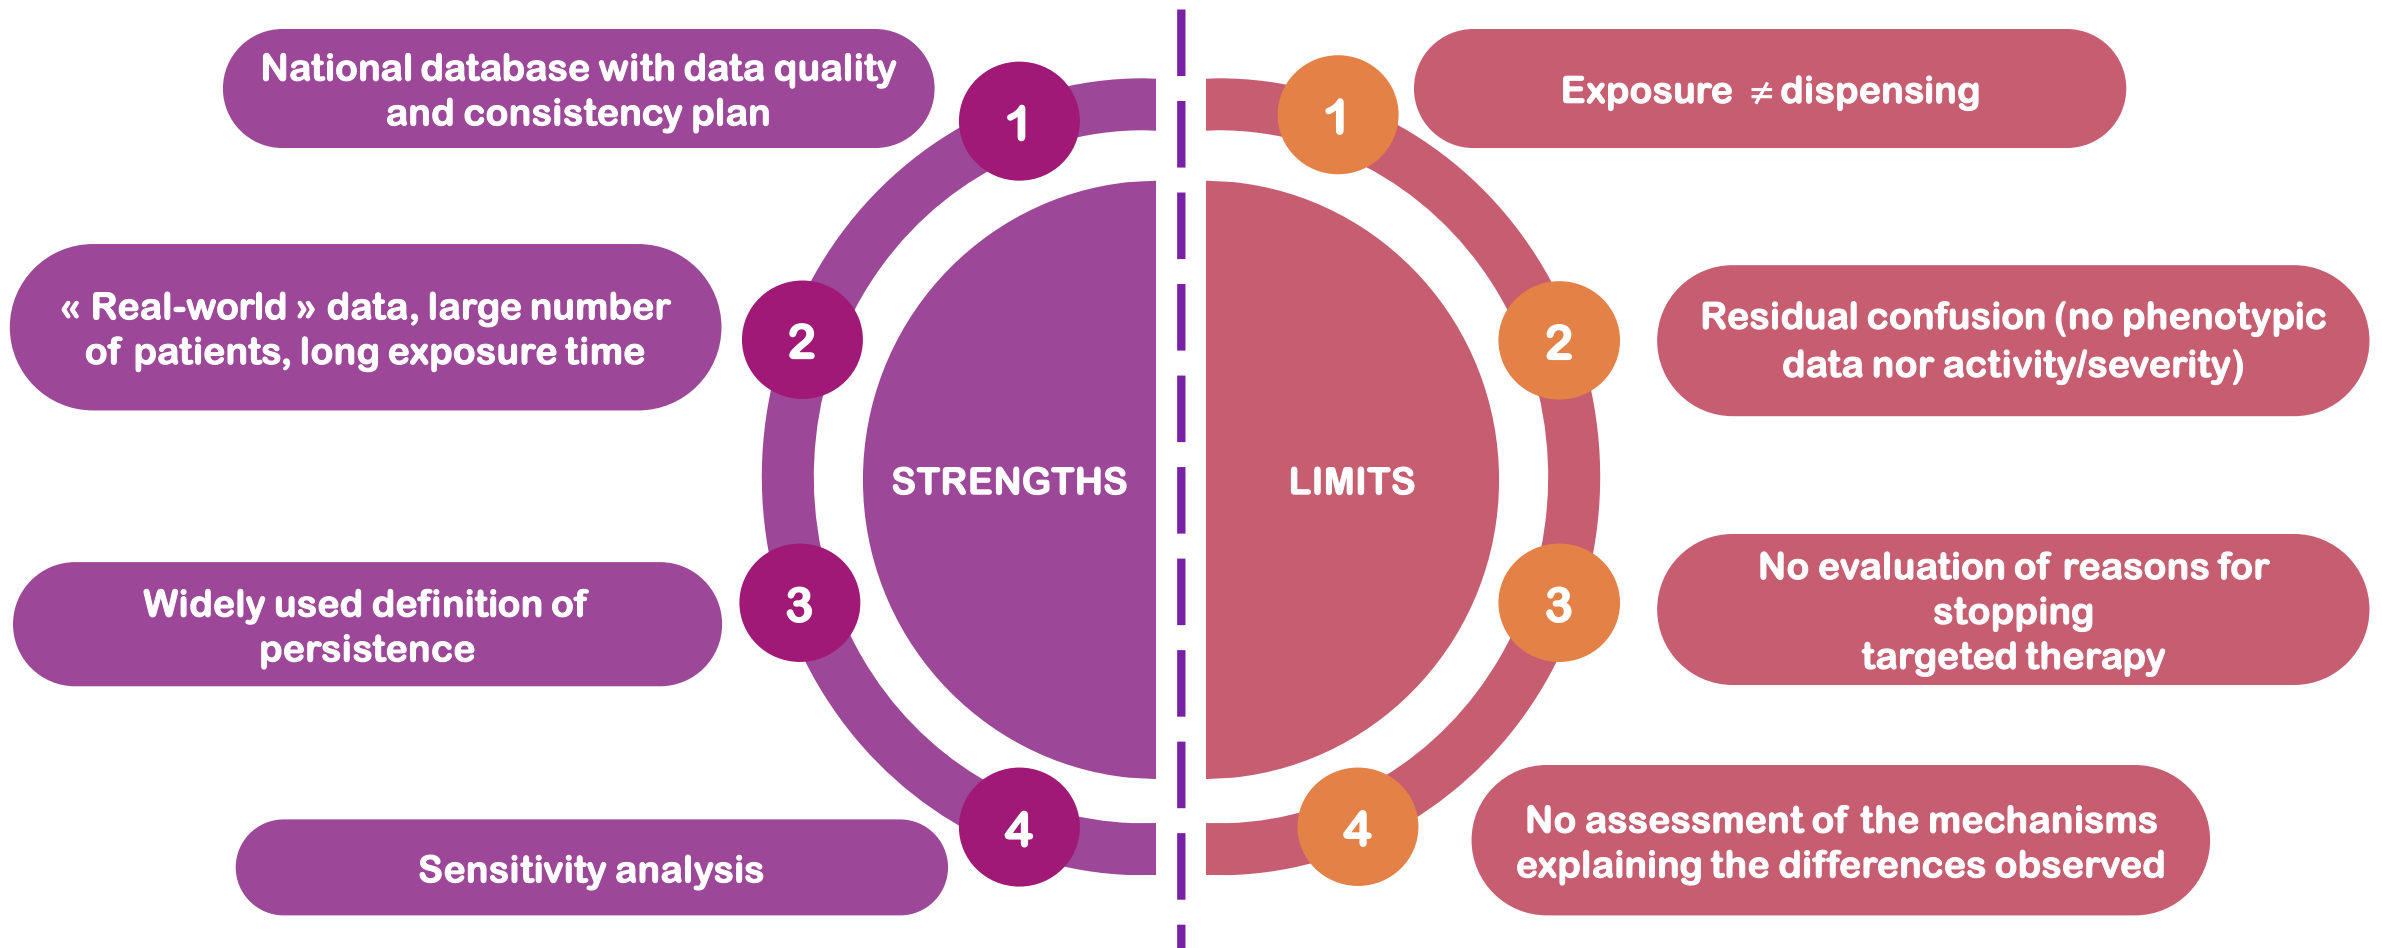

New users: 5 years

- ▶ Confirmation of the lower persistence of **TNFi** in women compared to men in **PsA**^{1,2}
- ▶ Few studies have specifically evaluated the impact of sex on responses to other therapies in PsA
 - Sex difference with **IL17i**: result consistent with a recent observational study³
 - No statistically significant difference for **IL12/23i**⁴, **IL23i**⁵ or **JAKi**⁶: consistent with observational data in psoriatic patients
- ▶ Hypotheses^{7,8}: difference in phenotype, activity, severity of disease; different immune response; gender effect

¹Glintborg B et al. Arthritis Rheum. 2011 ; ²Stober C et al. Rheumatology (Oxford). 2018 ; ³Ramonda R et al. RMD Open. 2021 ; ⁴Pogácsás L et al. J Dermatol Treat. 2017 ; ⁵Rocuzzo G et al. Clin Exp Dermatol. 2023 ; ⁶Eder L et al. RMD Open. 2023 ; ⁷Eder L et al. Ann Rheum Dis. 2013 ; ⁸Tarannum S et al. Nat Rev Rheumatol. 2022.

Confirmation of lower persistence of **TNFi** in women than men with PsA

The sex difference in persistence also concerned **IL17i**, but is no longer significant for **IL12/23i**, **IL23i** and **JAKi**

Need for studies based on sex and gender

Influence of sex on the persistence of different classes of targeted therapies for psoriatic arthritis

a cohort study of 14,778 patients from the French health insurance database (SNDS)
